

## Swing Carriage

Swing Carriage - The load capacity of a forklift jib has a most of roughly 1935 lbs up to 6000 lbs on either the extended or retracted positions range. You may need to check with a material handling specialist concerning the specific restrictions of your lift truck use. The load capacity ratings are meant for the jib itself and not the forklift or the maximum load which could be lifted securely using a particular lift truck. It is essential to bear in mind that each time whatever accessories such as a forklift jib are attached to the lift truck, the new center of gravity created by the attachment would decrease the general lift capability of the forklift. There are instructions available that offer details on how to accurately gauge these load limits.

Before making use of a forklift jib, ensure that it is properly secured to the lift truck using shackles and hooks. Continuously make sure in order to verify that the screw pins are tight. It is vital to also double check that the weight calculations have been done properly. Remember to take into account the truth that rated capacities sometimes lessen whenever the boom is in an elevated position, whenever the boom is fully extended with telehandlers or whenever the mast is slanted forward.

A few significant suggestions about the adjustable jib are: do not ever pull a load with a lift truck jib attachment, in view of the fact that these types of accessories are really meant for vertical lift only. Always lift the load without letting it move to and fro. Use extreme caution every time a load is carried to be able to prevent tipping over the truck.
